The programming model and register set are fairly conventional, ultimately based on the register structure of the Datapoint 2200 (which the related 8086 family also inherited). The Z80 was designed as an extension of the 8080, created by the same engineers, which in turn was an extension of the 8008. The 8008 was basically a PMOS implementation of the TTL-based CPU of the Datapoint 2200.

Thanks for the great article and for the reference to filter.pdf (my document from ages ago!). This is definitely one of the better explanations I've seen about making a Kalman filter for angle estimation based on accelerometer/gyro data.

This article describes using an RFM01 or RFM12b FSK RF transceiver with a Raspberry Pi to receive sensor data from a Fine Offset WH1080 or WH1081 (specifically a Maplin N96GY) weather station's RF transmitter.
