Desire for alcohol may transition into a pathological craving for these effects. This craving is strongly associated with alcohol dependence (1). Other changes in the brain increase a heavy drinker's risk for experiencing alcohol withdrawal—a collection of symptoms that can appear when a person with alcohol dependence suddenly stops drinking.

### **NEUROSCIENCE: PATHWAYS TO ALCOHOL DEPENDENCE**

"Neuroscience is showing that the pathways of addiction are based in the brain. Using advanced techniques such as imaging methods and studies with animal models, researchers are learning more about how alcohol interacts with the brain's communication system in different people.

The neurological pathway that leads to alcohol addiction is called the Reward or Pleasure pathway. This pathway involves multiple regions of the brain including the ventral tegmental area (VTA), the nucleus accumbens, and parts of the prefrontal cortex.

However, VP neurons are at the origin of multiple output pathways, with strong projections to ventral tegmental area (VTA), subthalamic nucleus (STN), lateral hypothalamus, among others, and the roles of these VP output pathways in reinstatement of drug seeking remain poorly understood.

Together, these data suggest that alcohol intake produces profound functional and structural plasticity events in a subpopulation of neurons in the DMS that control reinforcement-related learning. SIGNIFICANCE STATEMENT Alcohol addiction is considered maladaptive learning and memory processes.

One of the downstream dominos in the signaling pathway affected by alcohol is a gene called dopamine-2-like receptor, which makes a protein on neurons that recognizes dopamine, the "feel-good" neurotransmitter.

Neuroscience research as it relates to drug abuse has advanced knowledge about neurotransmitters and neural pathways, and has yielded information about brain mechanisms both under normal conditions and when affected by drugs of abuse.
