No: theorem 1.5.6 (parts (e) and (f)) concerns the intersection or union of two sets only. This can be extended easily to any intersection or union of a finite number of sets, though even this modest extension does require separate proof. The real problem is with intersections or unions of an infinite number of sets.

### 1.6 Families of Sets - Whitman College

In fact, technically, a family of sets need not be a set, because we allow repeated elements, so a family is a multiset. However, we do require that when repeated elements appear they are distinguishable.  $F = \{A_1, A_2, A_3, A_4\}$  with  $A_1 = \{a,b,c\}$ ,  $A_2 = \{a\}$ ,  $A_3 = \{a,d\}$  and  $A_4 = \{a\}$  is a family of sets.

### Families of Sets and Extended Operations - UC Denver

Theorem 2.2.8 in a slightly different form if the family of sets is not indexed. If  $F_1$  is a family of sets and  $F_2 \subseteq F_1$ , we call  $F_2$  a subfamily of  $F_1$ . Since  $B \subseteq A$  in Theorem 2.2.8,  $\{A_i^2\} \subseteq \{A_i\}$  is a subfamily of  $\{A_i\}$ . Swapping the notation in Theorem 2.2.8 for an arbitrary family  $F_1$  and a subfamily  $F_2$ , we have the following.

### PROOF INVOLVING SETS and INDEXED FAMILIES OF SETS

an infinite collection of sets cannot necessarily be labeled simply as  $A_1, A_2, A_3$ , etc. For each set,  $A_r$  in the above family, the index or label  $r$  is associated naturally with The indexing set  $(I, \mathcal{D})$  contains exactly one label for each set in the family.

### (PDF) Separation with restricted families of sets

With a little more background we can also define unions and intersections of arbitrary families of sets. Let  $J$  be a non-empty set, and let  $A_j$  be a set for each  $j \in J$ . In this situation we say that  $\{A_j\}_{j \in J}$  is a family (or collection) of sets indexed by  $J$ , and we refer to

Set theory is a basis of modern mathematics, and notions of set theory are used in all formal descriptions. The notion of set is taken as  $\in$ ,  $\subseteq$  primitive, or  $\in$ , so

Section 2.3 Indexed families of sets. Finite operations are useful, but only so far. Of course, restricting attention to finite operations may be useful when you want to do computation, but often it is more useful to use more general operations to prove theorems, and only later come back to find an efficient way to compute.

Prove that the ground set  $X$  has exactly 7 elements, and show that such a family  $F$  exists. Solution: Let  $L$  be the number of lines, i.e., sets in  $F$ , and let  $n$  be the size of the ground set.

### **Combinatorics of Sets - Carnegie Mellon University**

Sometimes angle brackets or braces are used instead of parentheses, the latter with the risk of mixing-up families with sets. An indexed family can be turned into a set by considering the set  $\{\hat{\alpha}\}$ , that is, the image of  $I$  under  $x$ .
