diant flux measurements. Back to equation (1), if photodiode's reflectance and internal quantum efficiency were known, the photodiode's responsivity would be known without being compared to another standard radiometer; i. e. the photodiode would be an absolute standard for optical radiation measurements [1, 2, 3].

measure of the quantity and quality of optical radiation seen by the PV devices are important in establishing technology performance^{1,2,3}. For laboratory sources, it is important that the quality of the illumination, as measured by the spectral distribution of the source, is comparable to sunlight or characterized for the departure from the

Traditionally the journal has covered methods that comprise solid state nuclear... Radiation Measurements provides a forum for the presentation of the latest developments in the broad field of ionizing radiation detection and measurement and publishes original papers on both fundamental and applied research.

Role of an optical detector. Many photonics applications require the use of optical detectors to measure optical power or energy. In laser-based fiber optic communication, a detector is employed in the receiver. In laser materials processing, a detector monitors the laser output to ensure reproducible conditions.

To the optical engineer, light is simply a very small part of the electromagnetic spectrum, sandwiched between ultraviolet and infrared radiation. The visible portion of the electromagnetic spectrum extends from about 380 to about 780 nanometers (nm), as shown in Figure 1.1.

To narrow the received optical bandwidth we have applied a filter to limit the spectral range of radiation reaching the detector (Fig.). (b). Optical filters based on the Bragg effect can have 5-nm bandwidth for $\lambda = 1.56 \mu\text{m}$, corresponding to a detection band, Δf , equal to 600 GHz.
