Highlights We propose to use electromagnetic (EM) devices for both vibration damping and energy harvesting. This study presents modeling and testing of linear EM dampers connected with four circuits. A good match is observed between the theoretical modeling and experimental testing. The promises and challenges of using EM dampers in structures for both purposes are discussed.

The rise of small-scale, portable electronics and wearable devices has boosted the desire for ways to harvest energy from mechanical motion. Such approaches could be used to provide battery-free power with a small footprint. Kim et al. present an energy harvester made from carbon nanotube yarn that converts mechanical energy into electrical energy from both torsional and tensile motion.

Piezoelectric nanogenerator. A piezoelectric nanogenerator is an energy harvesting device capable of converting external kinetic energy into electrical energy via action by a nano-structured piezoelectric material. Although its definition may include any types of energy harvesting devices using nano-structures to convert various types of ambient energy (e.g. solar power and thermal energy), it ...

Wind power is the use of air flow through wind turbines to provide the mechanical power to turn electric generators. Wind power, as an alternative to burning fossil fuels, is plentiful, renewable, widely distributed, clean, produces no greenhouse gas emissions during operation, consumes no water, and uses little land. The net effects on the environment are far less problematic than those of ...

A Simple Guide In Plain English. Introduction. Chi (qi) is an ancient Chinese term, which can be translated as energy. Like energy, the word chi is used in both abstract and concrete terms, and applied to both general concepts and specific phenomena. In other words, chi is ambiguous. (People who use the term often have a specific meaning in mind.)
